Launch Vehicle Propulsion & Systems

Rocket thrust can be explained using Newton's 2nd and 3rd laws of motion
 2nd Law: a force applied to a body is equal to the mass of the body and its acceleration in the direction of the force
 3rd Law: For every action, there is an equal and opposite reaction
 In rocket propulsion, a mass of propellant (m) is accelerated (via the

SOLID ROCKET MOTOR IGNITERS - NASA

SOLID ROCKET MOTOR IGNITERS 1 INTRODUCTION
 The propulsive force of a solid rocket motor is derived from the controlled combustion of the solid propellant fuel at high temperatures and pressures
 The function of the igniter is to induce this combustion reaction in a controlled and predictable manner and at stipulated rate

Rockets and 4.2.1 Launch Vehicles

Propulsion is also essential for controlling the attitude of a spacecraft, which way it is pointed
 One easy way of doing this is using small rockets called thrusters
 In this chapter we peel back the mysteries of rocket science to see how rockets work and how rocket scientists put together propulsion subsystems for spacecraft and launch vehicles

PART V SOLID ROCKET BOOSTER/REUSABLE SOLID ROCKET MOTOR Introduction
 The twin solid rocket boosters (SRBs), designed as the primary propulsion element of the STS, provided the Space Shuttle with 80 percent of the liftoff thrust during the first two minutes of launch
 They burned more than 2,200,000 pounds of propellant and produced 36 million
